

## PRODUCT OVERVIEW

Bent anchor bolts (also called L-Shaped anchor bolts) are embedded directly into concrete and used to anchor construction supports like structural steel columns, light poles, highway signs, heavy equipment, bridge rails, equipment and many other applications. The bolts are threaded on the top portion which allows light poles, steel columns or other structures to be fastened to them. The bottom bent portion or hook creates resistance so the bolt does not pull out of the concrete foundation when force is applied.
